

ЧТО ИСПОЛЬЗУЕМ

- Шрифт для заголовков – [скачать](#)
- Не в заголовках используем – Lab Grotesque K Regular (Основной текст)
- Основные цвета – ff007f 9700ff
- Дополнительные цвета темы можем использовать для графиков и сценариев, где нужно показать сравнение с 2-мя и более цветами

ЗАЧЕМ В МЛ НУЖНЫ ПРОИЗВОДНАЯ, БРИ И АЛГОРИТМЫ

Александр Панкратов

Разработчик машинного обучения

ЧТО ОБСУДИМ

- Для чего в точности нам нужны GPU, и не лучше ли Контру купить чугунный мост вместо GPU-серверов?
- Что именно нужно проделать с производной, чтобы нейросеть обучалась.
- Где и зачем в МЛ встречаются классические алгоритмы.

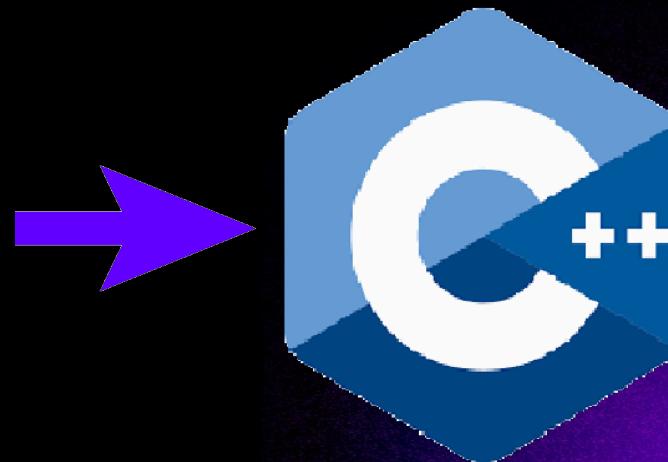

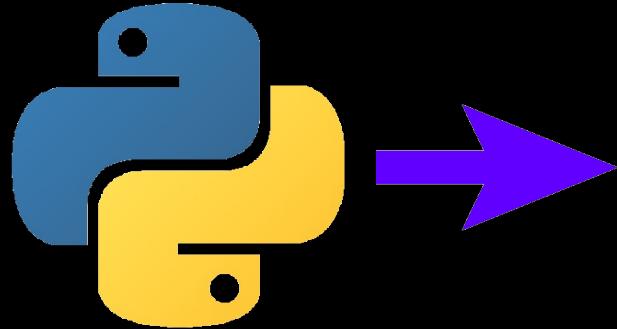

ЗАЧЕМ ДАТА-СТАНИСТУ GPU

ЧТО ВНУТРИ НЕЙРОСЕТИ

```
asr_model = nemo_asr.models.EncDecCTCModelBPE.from_pretrained(  
    model_name="stt_ru_conformer_ctc_large",  
)
```

ЧТО ВНУТРИ НЕЙРОСЕТИ

Robert_Crovella Moderator

It's probably coming from a cublas call, or a library that uses cublas, like cudnn. You won't find these kernels documented anywhere.

СКАНПЕРЫ И МИКРОСКОПЫ

```
asr_model, data = get_model_and_data(model_name="stt_ru_conformer_ctc_large", device='cuda')
with profile(with_stack=True, activities=[ProfilerActivity.CPU, ProfilerActivity.CUDA]) as prof:
    for processed_signal, processed_signal_length in data:
        asr_model.encoder(audio_signal=processed_signal, length=processed_signal_length)
with open("etc/profiler_outputs/gpu_forward_profiling", mode="w") as out:
    out.write(
        prof.key_averages().table(
            sort_by="self_cuda_time_total",
            max_name_column_width=4096,
            max_shapes_column_width=4096,
        )
    )
```

$$2235 / (148.755 + 146.863) \approx 7.56$$

$$1195 / 3340 * 2432 / (52.891 + 51.405) \approx 8.34$$

почему

КТО ТАКОЙ ADDMM

torch.addmm

```
torch.addmm(input, mat1, mat2, *, beta=1, alpha=1, out=None) → Tensor
```

Performs a matrix multiplication of the matrices `mat1` and `mat2`. The matrix `input` is added to the final result.

If `mat1` is a $(n \times m)$ tensor, `mat2` is a $(m \times p)$ tensor, then `input` must be **broadcastable** with a $(n \times p)$ tensor and `out` will be a $(n \times p)$ tensor.

`alpha` and `beta` are scaling factors on matrix-vector product between `mat1` and `mat2` and the added matrix `input` respectively.

$$\text{out} = \beta \text{ input} + \alpha (\text{mat1}_i @ \text{mat2}_i)$$

КАК УМНОЖАТЬ МАТРИЦЫ

$$\begin{bmatrix} a_1 & a_2 & a_3 \\ a_4 & a_5 & a_6 \\ a_7 & a_8 & a_9 \end{bmatrix} \begin{bmatrix} b_1 & b_2 & b_3 \\ b_4 & b_5 & b_6 \\ b_7 & b_8 & b_9 \end{bmatrix} = \begin{bmatrix} c_1 & c_2 & c_3 \\ c_4 & c_5 & c_6 \\ c_7 & c_8 & c_9 \end{bmatrix}$$

$$c_1 = a_1b_1 + a_2b_4 + a_3b_7$$

КТО ТАКОЙ CONVOLUTION

Conv1d

```
CLASS torch.nn.Conv1d(in_channels, out_channels, kernel_size, stride=1, padding=0, dilation=1,  
    groups=1, bias=True, padding_mode='zeros', device=None, dtype=None) [SOURCE]
```

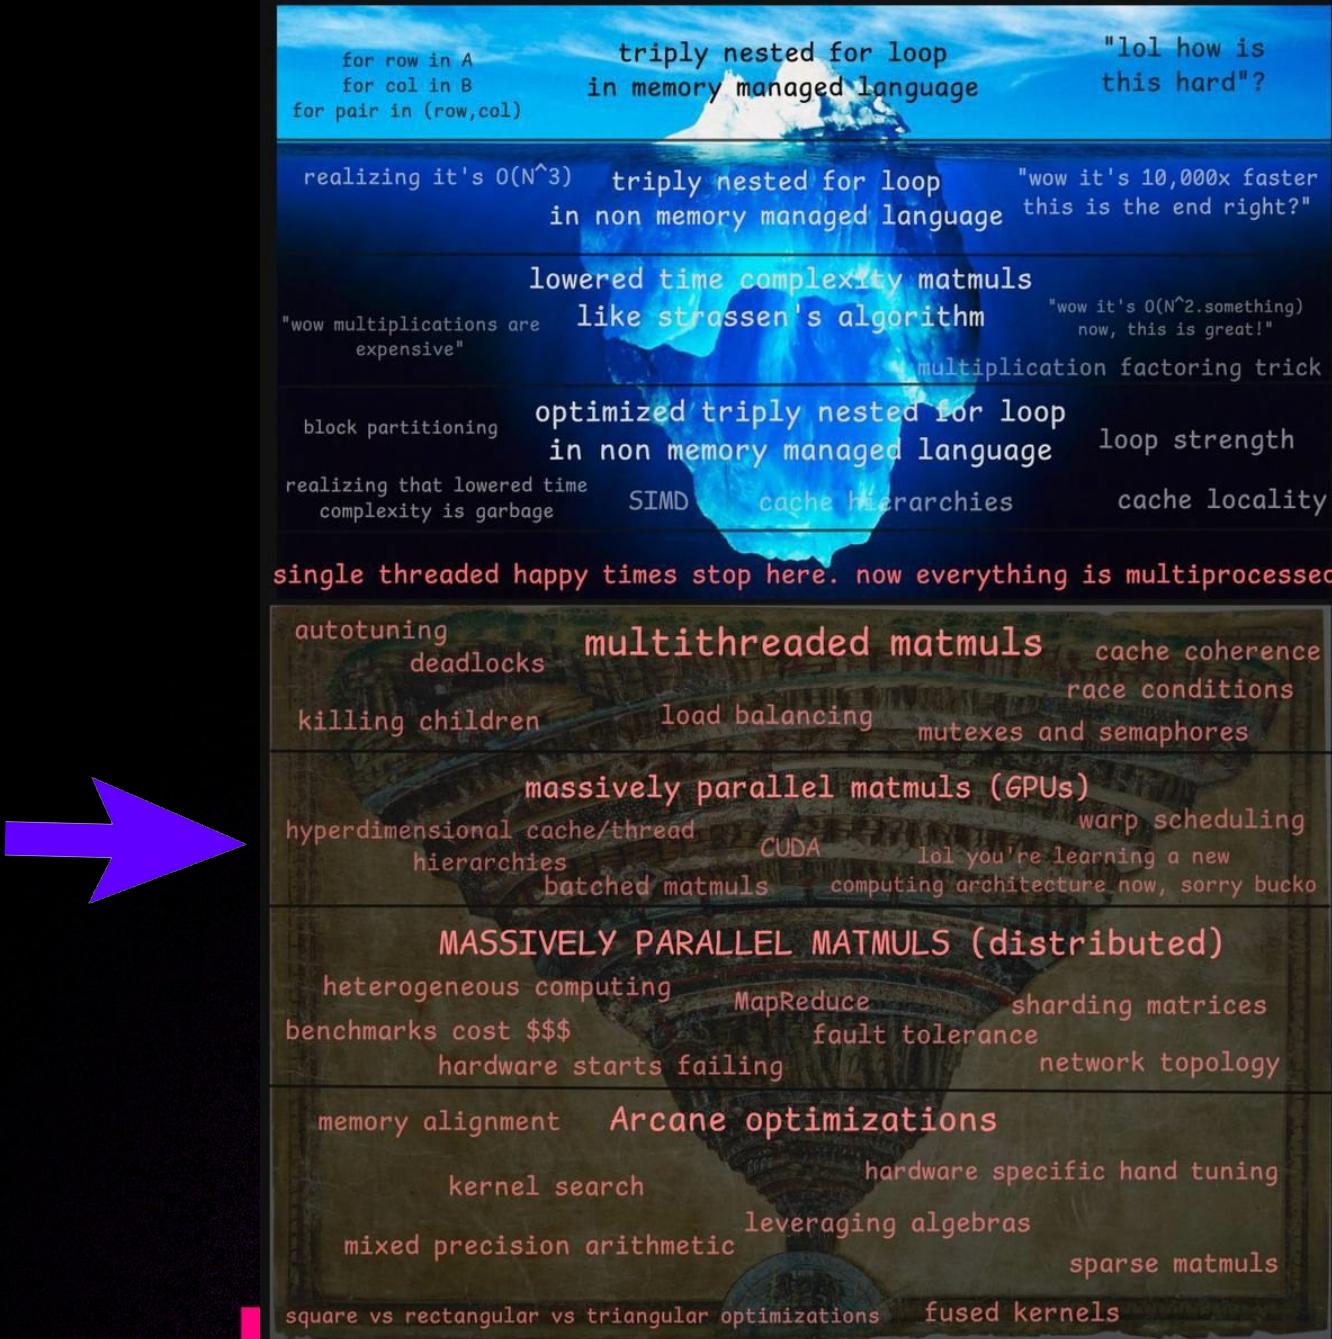

Applies a 1D convolution over an input signal composed of several input planes.

In the simplest case, the output value of the layer with input size (N, C_{in}, L) and output $(N, C_{\text{out}}, L_{\text{out}})$ can be precisely described as:

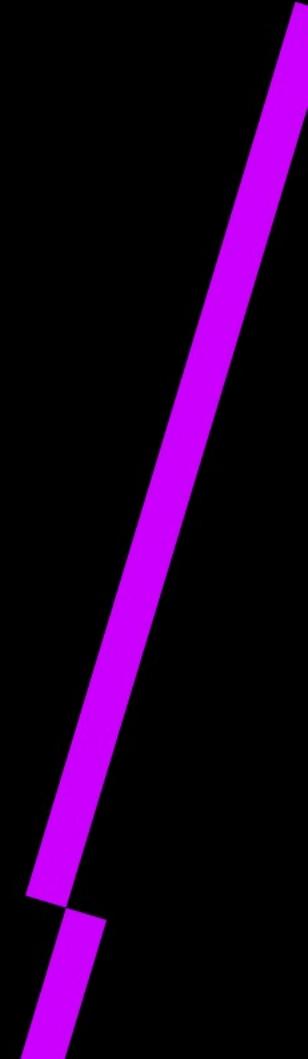

$$\text{out}(N_i, C_{\text{out}_j}) = \text{bias}(C_{\text{out}_j}) + \sum_{k=0}^{C_{\text{in}}-1} \text{weight}(C_{\text{out}_j}, k) \star \text{input}(N_i, k)$$

The nine circles of matmul

ВНУТРИ GPU

KTO TAKOЙ STREAMING MULTIPROCESSOR?

16.7. Compute Capability 8.x

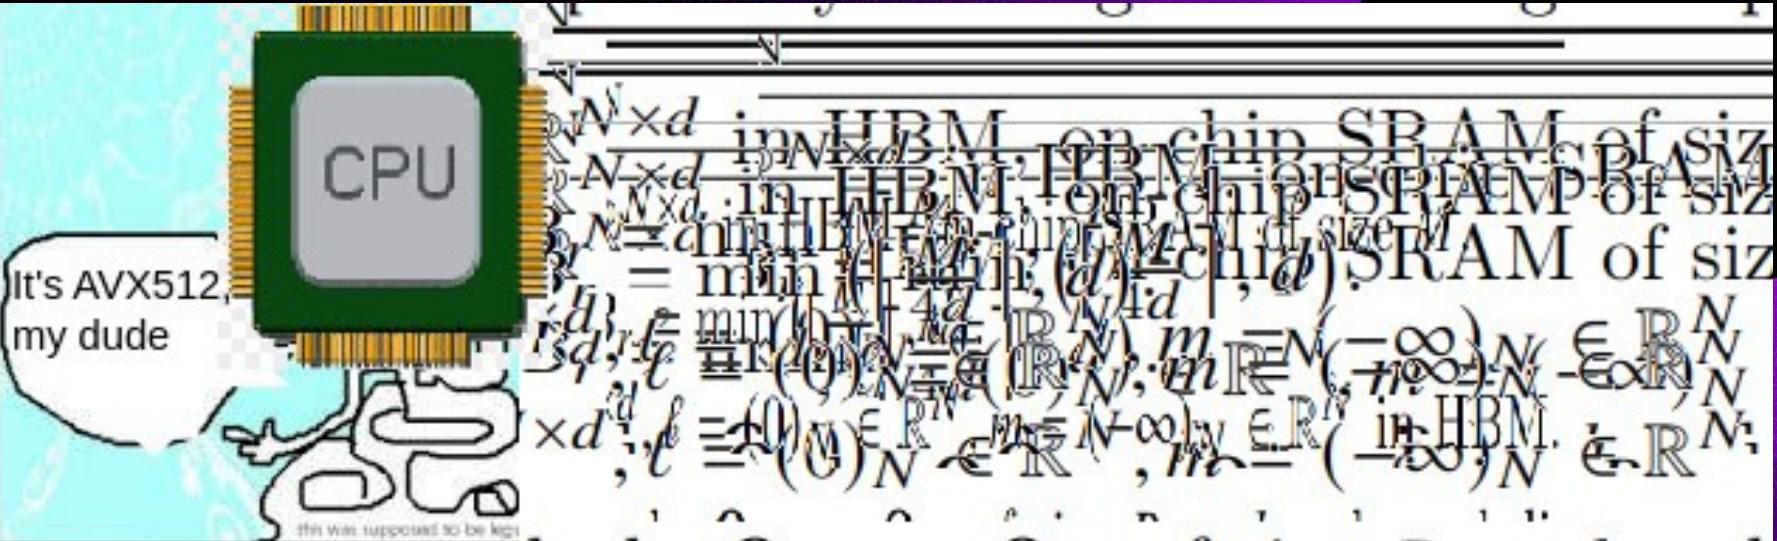

16.7.1. Architecture

A Streaming Multiprocessor (SM) consists of:

- 64 FP32 cores for single-precision arithmetic operations in devices of compute capability 8.0 and 128 FP32 cores in devices of compute capability 8.6, 8.7 and 8.9,
- 32 FP64 cores for double-precision arithmetic operations in devices of compute capability 8.0 and 2 FP64 cores in devices of compute capability 8.6, 8.7 and 8.9
- 64 INT32 cores for integer math,
- 4 mixed-precision Third-Generation Tensor Cores supporting half-precision (fp16), `__nv_bfloat16`, `tf32`, sub-byte and double precision (fp64) matrix arithmetic for compute capabilities 8.0, 8.6 and 8.7 (see [Warp matrix functions](#) for details),
- 4 mixed-precision Fourth-Generation Tensor Cores supporting `fp8`, `fp16`, `__nv_bfloat16`, `tf32`, sub-byte and `fp64` for compute capability 8.9 (see [Warp matrix functions](#) for details),
- 16 special function units for single-precision floating-point transcendental functions,
- 4 warp schedulers.

Overall, H100 provides approximately 6x compute performance improvement over A100 when factoring in all the new compute technology advances in H100. Figure 10 summarizes the improvements in H100 in a cascading manner:

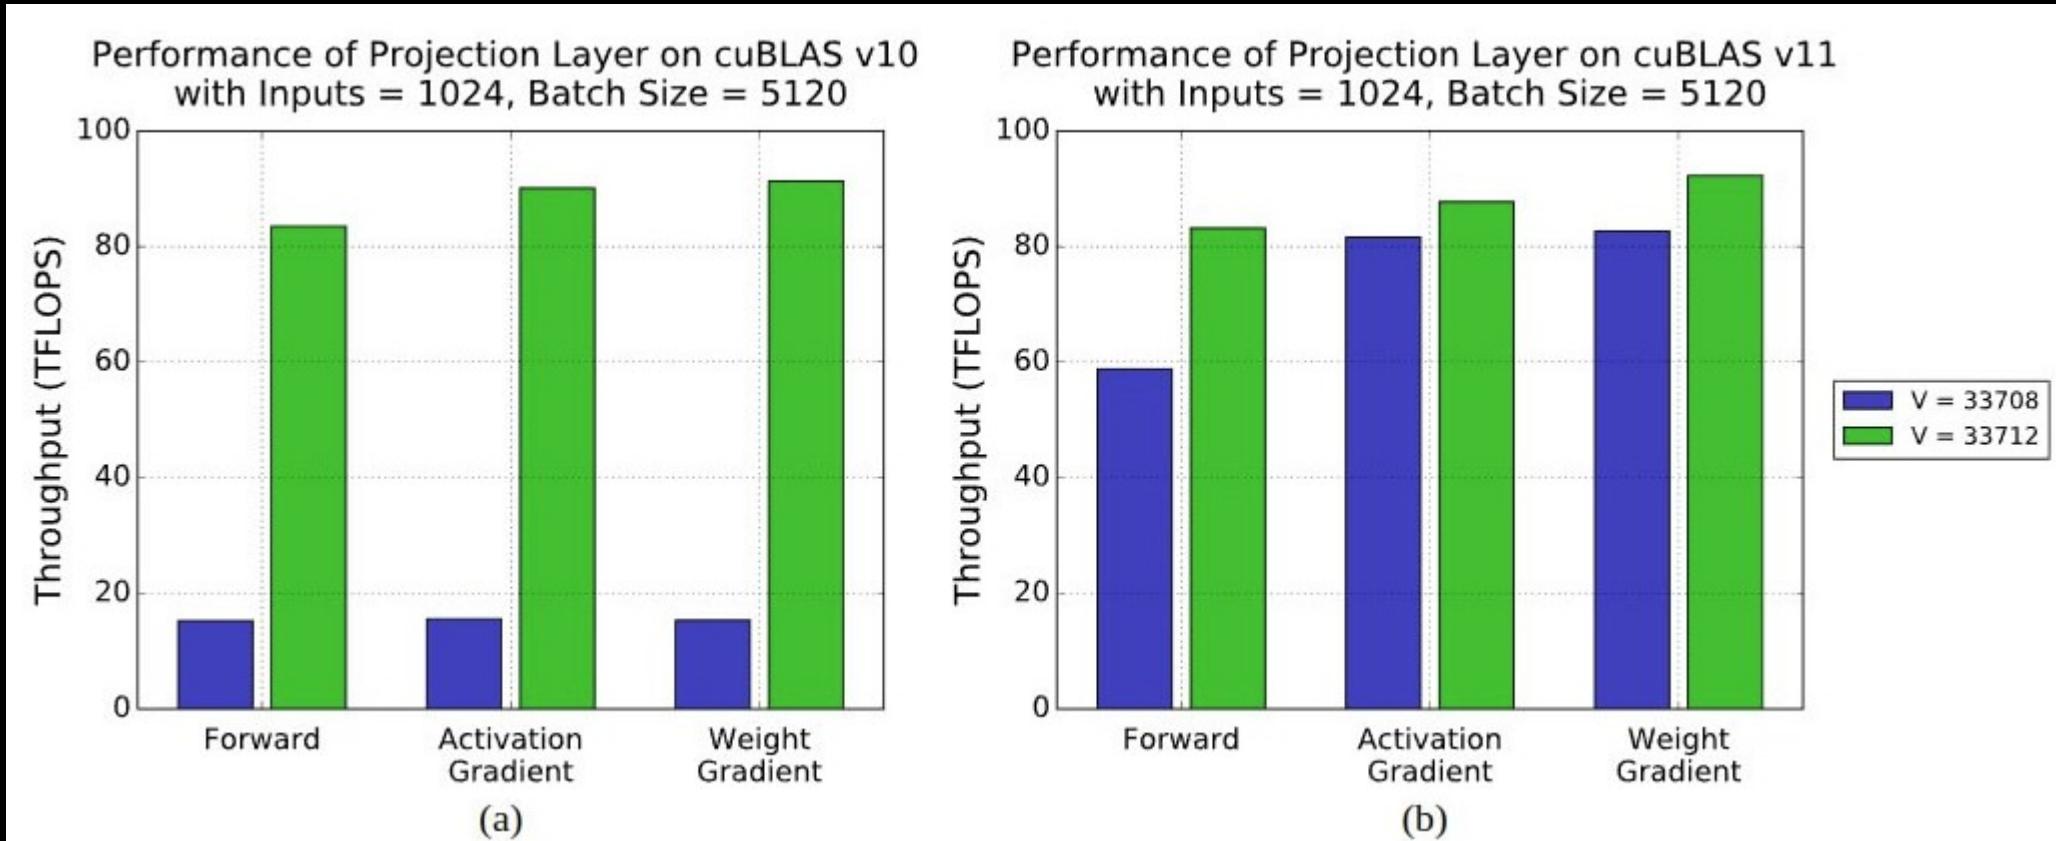

- 132 SMs provide a 22% SM count increase over the A100 108 SMs

multiplication for deep learning workloads and is *incredibly* fast. Each tensor core can execute an entire 16×16 mma (matrix multiply and accumulate) in a single clock cycle (~0.75ns for RTX 3090).

$$D = \left(\begin{array}{cccc} A_{0,0} & A_{0,1} & A_{0,2} & A_{0,3,4} \\ A_{1,0} & A_{1,1} & A_{1,2} & A_{1,3,4} \\ A_{2,0} & A_{2,1} & A_{2,2} & A_{2,3,4} \\ A_{3,0} & A_{3,1} & A_{3,2} & A_{3,3,4} \\ A_{4,0} & A_{4,1} & A_{4,2} & A_{4,3,4} \end{array} \right) \text{FP16} + \left(\begin{array}{cccc} B_{0,0} & B_{0,1} & B_{0,2} & B_{0,3,4} \\ B_{1,0} & B_{1,1} & B_{1,2} & B_{1,3,4} \\ B_{2,0} & B_{2,1} & B_{2,2} & B_{2,3,4} \\ B_{3,0} & B_{3,1} & B_{3,2} & B_{3,3,4} \\ B_{4,0} & B_{4,1} & B_{4,2} & B_{4,3,4} \end{array} \right) \text{FP16} + \left(\begin{array}{cccc} C_{0,0} & C_{0,1} & C_{0,2} & C_{0,3,4} \\ C_{1,0} & C_{1,1} & C_{1,2} & C_{1,3,4} \\ C_{2,0} & C_{2,1} & C_{2,2} & C_{2,3,4} \\ C_{3,0} & C_{3,1} & C_{3,2} & C_{3,3,4} \\ C_{4,0} & C_{4,1} & C_{4,2} & C_{4,3,4} \end{array} \right) \text{FP16 or FP32}$$

...

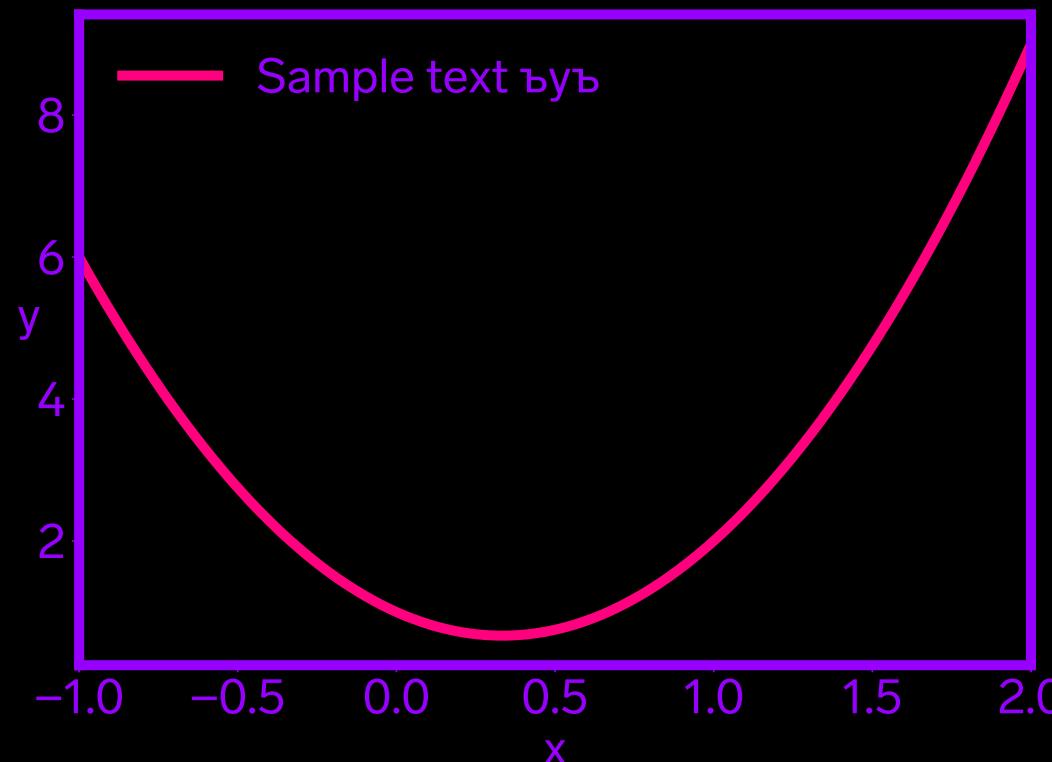

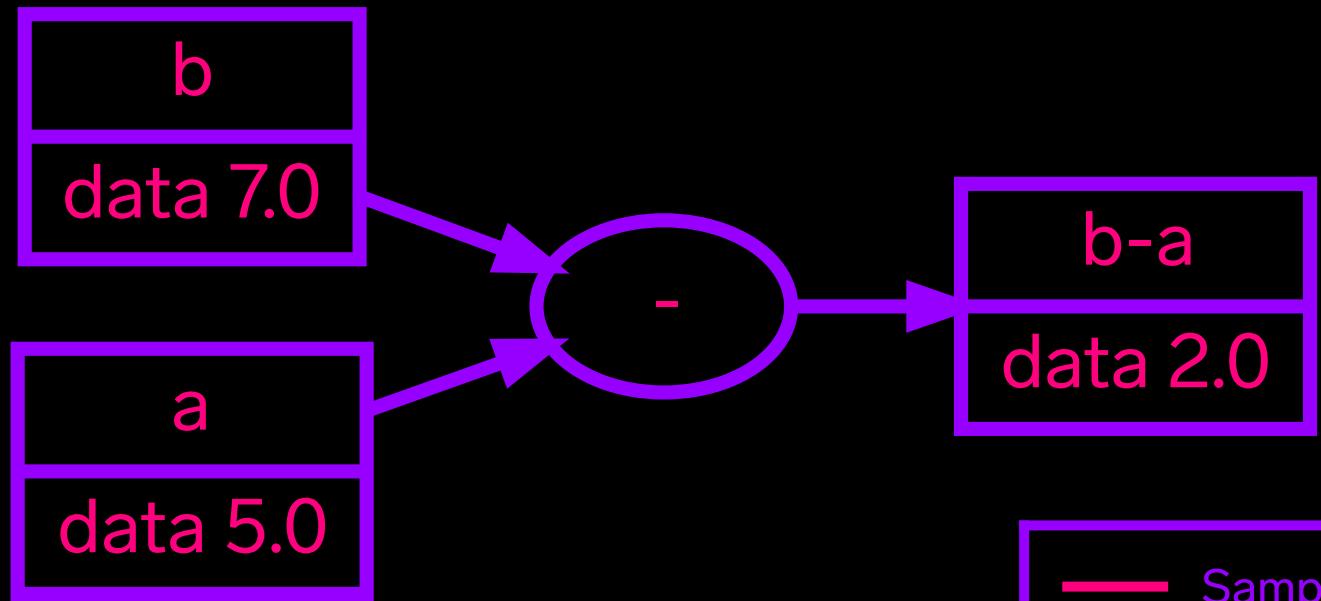

The most dramatic optimization to nanoGPT so far (~25% speedup) is to simply increase vocab size from 50257 to 50304 (nearest multiple of 64). This calculates added useless dimensions but goes down a different kernel path with much higher occupancy. Careful with your Powers of 2.
